We preferred instead to use directly the very accurate values from 1 , where the polynomial coefficients are provided for up to tile degree 30. Once these coefficients are input, we proceed as before, calling a polynomial rootfinder and evaluating the partial fraction coefficients. The big advantage of Chebyshev methods, stressed in the work by Varga, is the ability to use large step size. In fact, when A is Hermitian, a relation of the form $lw (t) - w , , , lh Am, Nw0-A-lr l Vt 0$ holds, where win, , is the solution computed with an (m, r) order Chebyshev approximation, and Am, are constants converging to zero geometrically (see 3 and 1 for a list of A, , , s). Although such a technique will have its limitations for time-varying co-efficients and boundary conditions, it can often produce excellent results as is demonstrated in our experiments. Thus by combining the large time step, together with the problem decoupling for parallelism, we obtain a very ef-ficient procedure in the sense that fast convergence, low error and efficient exploitation of the parallel resources are achieved. 4. 5. Handling complex poles. The partial fractions in the decompo-sition could involve complex shifts of the operator A. These complex shifts come in conjugate pairs and correspond to complex poles of the rational func-tion under consideration, that is the roots of the (real) denominator. Similar problems occur...
